

Methodology: RedrobRank

Architecture

The ranker processes candidates.jsonl using a deterministic, rule-based feature extractor and a highly calibrated weighting algorithm.

- **Extraction:** Streams JSONL, extracting text from profile headlines, summaries, and career histories.
- **Scoring:** Applies pre-defined keyword lists targeting:
 - Core AI & Retrieval
 - Production deployments (MLOps, scaling)
 - Evaluation (NDCG, MAP, A/B testing)
 - Python/Systems infrastructure.
- **Honeypot/Trap Detection:** Disqualifies candidates claiming "expert" status with minimal time experience, or keyword stuffers lacking evidence of production deployment.
- **Redrob Behavioral Signals:** Modulates baseline technical score relying upon profile activity and location matches.
